INTEGRATION
OF POWER SYSTEM

We Light Up the Taipei 101, Once the highest building in the world

22.8KV Substation in every 10 floor.

- CRTR :3P 22.8KV 2~4MVA * 70 PCS
- PANEL :3P HV&/LV* 1780 SETS

161KV Substation in B4 Belong to TPC

- TR :3P 161/22.8KV 60MVA * 4 PCS
- GIS:3P 161/22.8KV 60MVA * 4 PCS

High voltage power capacitors

High voltage capacitors-internal fuse type	2
High voltage capacitors-standard type (non-internal fuse)	6
Coefficients calculation on capacitance variation after increase Of high voltage capacitor voltage	8
Series reactor selection after increase of capacitor's voltage	9
Operation Notes	10
Maintenance and service for the high voltage capacitors	10

Low voltage power capacitors

Low voltage explode-proof power capacitor KS	12
Low voltage explode-proof power capacitor KJ	15
Low voltage explode-proof power capacitor KR	18
Harmonic-resistant capacitor series	21
μ f type indoor capacitor series	23
Low voltage power dry type H class reactor series	25
Series reactor selection after increase of capacitor voltage	29
Low voltage power capacitors general inspection and diagnose	29
Low Voltage Capacitor's Maintenance	30
Capacitance coefficients calculation on capacitors to be installed	30
Coefficints variation of capacitanc after increase of capacitor voltage	32

High voltage power capacitors

High Voltage Capacitors-Internal Fuse Type

Advantages - Operation will continue after the fuses are actuate

With Internal Fuse Type

When one capacitor element inside the power capacitor breaks down, the internal fuse will rapidly cut off, and remove malfunction element so the operation will not be interrupted.

Standard Type

When one capacitor elemen inside the capacitor breaks down, the external protective fuse will rapidly cut off, and stop operation. Whole power capacitor must be replaced.

The decrease of capacitance is insignificant

With Internal Fuse Type

When the fuse of an internal capacitor element cuts off, only its capacitance will be lost.

Standard Type

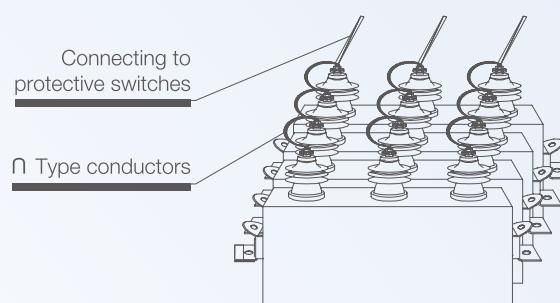

For the standard, the total capacitance of entire power capacitor will be lost even there is only one capacitor element breaks down.

Smaller installation space

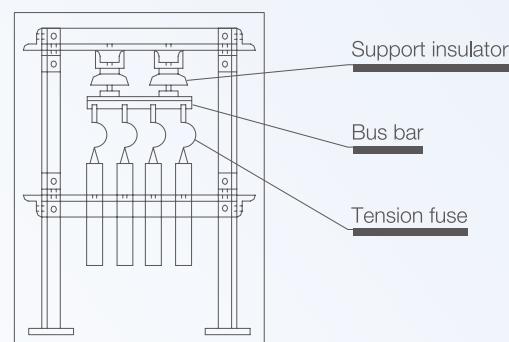

With Internal Fuse Type

Installation space for the internal fuse type capacitor can be drastically decreased because it can be linked directly with conductors into n type in parallel connection. It is particularly suitable for installing in a panel and the cost for power distribution equipment can be saved.

Standard Type

To compliance with the Electro-technial Codes, Art. 436, a conventional type capacitor must be installed with support insulators for the bus bars and further fitted with tension fuses. Consequently larger installation space are required.

Internal type and standard type capacitors comparisons summary

Item	Internal Fuse Type	Conventional Type
Installation space	Small	Larger
Continuous usability after actuation of one element	Excellent	Depends on different condition
Reactive power loss	Low	Average
Imbalance protection	Good	Average
Fuse Protection	Good	Average
Case breakdown possibility	Low	Average
Fuse misoperation possibility	Low	Average

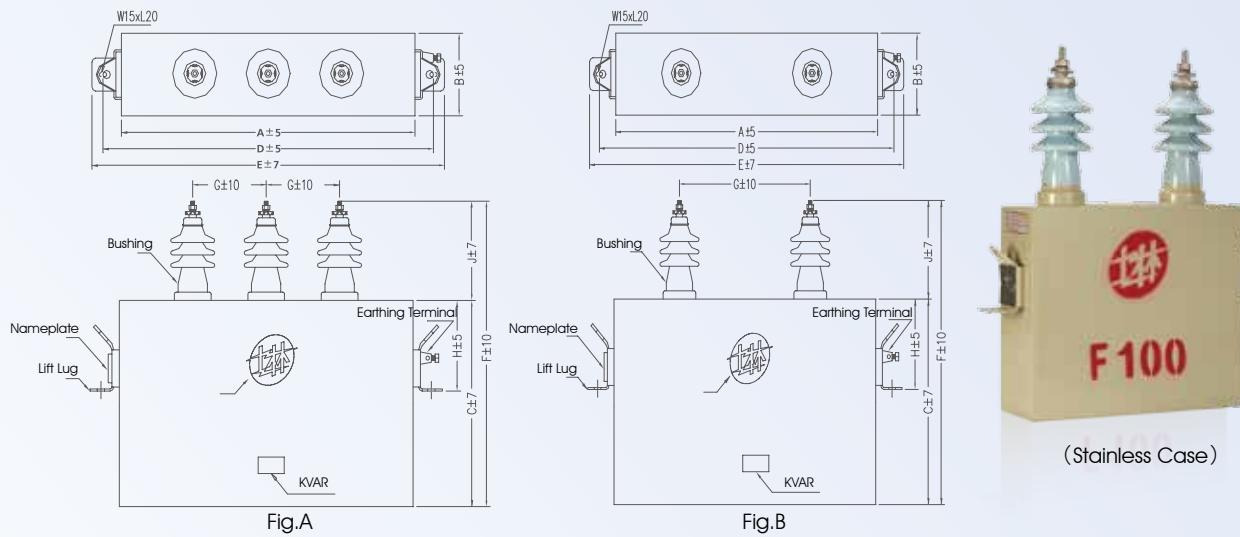

Specifications and Performances

Installation Location	Both indoor and outdoor
Ambient Temperature	- 20°C ~ + 40°C (24-hr average: lower than 35°C)
Max. Working Voltage	Within 110% rated voltage (24-hr average: lower than 110%)
Max. Working Current	Within 135% rated current (including high harmonic wave and manufacturing tolerance)
Capacity Tolerance	- 5% ~ + 10% of rated value (within 3% phase-to-phase tolerance)
Loss	Less than 0.35% at 20°C
Temperature Rise	Lower than 25°C when ambient temperature is lower than 40°C
Sealing	No trace of oil leaking outside of capacitor case after heating in constant temperature tank at 80 ± 5°C for 4 hrs
Discharge	With built-in discharge resistor, residual voltage drops to lower than 50V after capacitor is disconnected from power for 5 minutes
Safety	Excellent, due to individual fuse protection for every single unit inside the capacitor.
Standards	CNS 1372 and 3739, JIS C4902

High / Low Voltage Power Capacitors

Diagram Dimensions

For capacitors not listed in below specifications tables, or compound capacitors made up of several units as well as associate steel mountings, switches, protective equipment etc., Shihlin Electric can also provide design and manufacturing services.

(3) Coefficients Calculation On Capacitance Variation After Voltage Increase.

System Voltage(KV)	(KV) Intended increase of rated voltage (KV) for the capacitor											
	3.45	3.8	4.0	4.16	4.6	4.8	11.95	12.8	13.8	23.9	25.4	27.5
3.3	1.093	1.326	1.469	1.589	1.943	2.116	-	-	-	-	-	-
4.16	-	-	-	-	1.223	1.331	-	-	-	-	-	-
11.4	-	-	-	-	-	-	1.099	1.261	1.465	-	-	-
22.8	-	-	-	-	-	-	-	-	-	1.099	1.241	1.455

Example of application

Assuming the system voltage is 11.4KV, the required capacitance is 100KVAR. Taking into consideration of voltage rise due to series reactor or high harmonic content, the actual capacitance as follows:

Required capacitor capacitance = 100×1.261 (obtained from above table) = 126.1KVAR

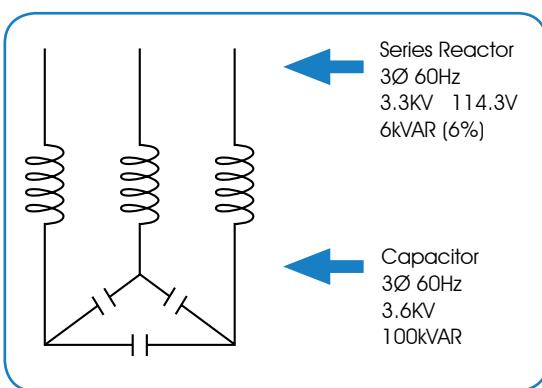

(4) Series Reactor Selection After Increase Of Capacitor Voltage

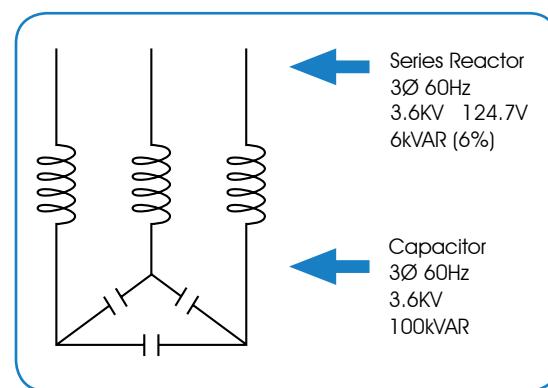

Wrong Series Reactor
System Voltage 3.3KV

Correct Series Reactor
System Voltage 3.3KV

The rated voltages of reactor and capacitor are different, the resistance ratio is 5.04% (not 6%)

The rated voltages of reactor and capacitor are the same, the resistance ratio is 6%

Calculation of the ratio of Capacitance and Reactance

$$\begin{aligned}
 (3300V/\sqrt{3}) \times 6\% &= 114.3V \\
 XL = V^2/Q &= 114.3^2/6kVAR/3 = 6.532\Omega \\
 XC = V^2/Q &= 3600^2/100kVAR = 129.6\Omega \\
 XL/XC &= 6.532/129.6 = 5.04\%
 \end{aligned}$$

$$\begin{aligned}
 (3600V/\sqrt{3}) \times 6\% &= 124.7V \\
 XL = V^2/Q &= 124.7^2/6kVAR/3 = 7.775\Omega \\
 XC = V^2/Q &= 3600^2/100kVAR = 129.6\Omega \\
 XL/XC &= 7.775/129.6 = 6\%
 \end{aligned}$$

A suggestion is proposed here, that is to choose the reactor whose rated voltage is the same as capacitor's.

(5) Operation Notes

1. Please use the capacitors at ambient temperature within range from -25°C ~ +40°C.
2. Please do not move the capacitors by the sleeves, and never use a coin to do the parallel connection.
3. When the capacitors are installed side by side, please keep the distance between each capacitor for more than 8cm for better heat dissipation.
4. The sleeves and terminals should be kept in clean condition to avoid poor insulation, and maintenance should only be performed after being disconnected from power for more than 5 minutes.
5. System harmonic content should be taken into consideration, and voltage-withstand rating of capacitor's rated voltage should be upgraded.
6. In application of automatic power adjusting panel, because frequent throw-ins and throw-outs, please connect series reactor at each stage, and upgrade the capacitor's voltage-withstand rating.
7. To prevent damages caused by overlapping voltage, throw-in time should be set at 5 minutes after capacitor has been disconnected.
8. Capacitors should be linked with series reactors in order to suppress surges and harmonic waves. Voltage rise of the capacitor should be watched when series reactor is connected. The rise of capacitor voltage is 6.4% when a 6% series reactor is connected, and it is 15% when a 13% series reactor is connected.
9. Non-combustible insulating oil is adopted in our capacitors. Furthermore, internal fuse type meets the Electro-technical Codes, Art 436, and individual fuse protection has been provided for each capacitor element. For conventional type (Non Internal Fuse), to meet the Electro-technical codes, please use individual fuse protection for each capacitor unit to enhance safety and fire protection.

(6) Maintenance And Service For The H.V. Capacitors

1. The capacitor's ambient temperature must be lower than 40°C. At installation consider following situations: surrounding temperature rise and stability, ventilation provision, and heat source radiation. Suggest customers install capacitors in a well ventilated location
2. There are switches various kinds of protection facilities, attention must be paid to switches' contact points whether they are working properly.
3. Check whether working voltage and current are normal, over-voltage will lead to increase of capacitor's capacitance and rise of temperature. In addition to endanger the capacitor's life, the abnormal voltages will also frequently cause internal insulation components to breakdown.
4. Check the capacitor insulators and its case when oil leaking (including breaking) is detected. The capacitor should be well covered immediately and forwarded to factory for repair. To avoid insulation oil degraded caused by oil leak and moisture buildup inside capacitor, case should be repaired immediately.
5. Check sparks or abnormalities caused by inferior contacting points between the capacitor terminals and conductors, which often result in fuse cut-outs during operation.
6. Check for other abnormal phenomena.
7. Clean up the dirt and dust on the ceramic sleeve surfaces. Dirt and dust will accumulate on the sleeve surfaces of the capacitors either installed indoor or outdoor after a long time. If moisture is absorbed, there will be inferior insulation which will lead to trip of the protective equipment and cause serious electric leakage. Clean up dirt and dust on the sleeve surfaces should only be proceeded after the capacitor is disconnected from power for more than 5 minutes, and has been discharged through ground to avoid electric shock.
8. The measured insulation resistance values between T&C, must above 1000MΩ.

(7) Measurement of Capacitance

1. After capacitor is fully discharged
(measuring by direct reading capacitance meter).
 2. Measurement method
 - $U-V=a$, $V-W=c$: measuring for 3 times.
 - Total capacitance = $(a+b+c) \times 2 \div 3$
 - Conclusion :
- * Actually measured capacitance $a \approx b \approx c$
 * Total capacitance \approx capacitance indicated on the nameplate

Direct reading capacitance meter

Low Voltage power capacitor

Characteristic

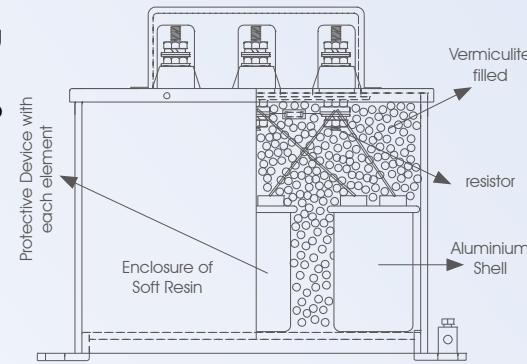

- Low loss of medium and temperature with long serving time to save electricity bill.
- This is a special green product produced by Shihlin Electric and use flame retardant EPOXY(UL-94V0) resin and seal,
- hence the oil leakage oil can be prevented so does the pollution of environment.
- The capacitor meets the CNS、JIS and IEC standards. Every individual capacitor has a internal safety device (approved by UL, E105535), when the capacitor faults, it will cut off power supply automatically to prevent the occurrence of secondary hazard.
- The capacitor is equipped with discharge resistors to ensure the safety of electrification and maintenance.
- This is an unique Eco-friendly product made by Shihlin. Sealed with Epoxy(UL-94V0) soft resin, it eliminates oil leak in operation, reduces erosion, and environmental pollution.

(1) Low voltage explode-proof power capacitor KS

Characteristic

- The capacitor is made with high-voltage endurance and excellent dielectric metallized polypropylene film. It provides self-healing function, when the film breaks, the metallized electrode around the spark hole will be evaporated and recovers insulation at the same time, so the capacitor can still work normally.
- The capacitor is sealed and put in an aluminium shell,. This aluminium shell attached to inside iron case wall which provide a good heat dissipation ability and extremely slow temperature rise.
- It has sequential protection ability and high safety reliability. Each individual capacitor element is protected by pressure-type protective device and installed in a vermiculite filled case which provide fire-proof and explode-proof. Vermiculite is hard to burn and is highly compressible. Capacitors' cases are made of high strength steel material. If capacitor fails and releases large energy the vermiculite can suppress impact to keep case from deformed. This filled material act as fire sand to isolate air to possible combustion and disaster greatly prevented.
- Low loss of medium and temperature with long operation life that helps to save electricity bill.
- The capacitor is equipped with discharge resistors to ensure the safety of electrification and maintenance.
- This is an unique Eco-friendly product made by Shihlin. Filled with soft resin, it eliminates oil leak in operation, reduces erosion, and environmental pollution.

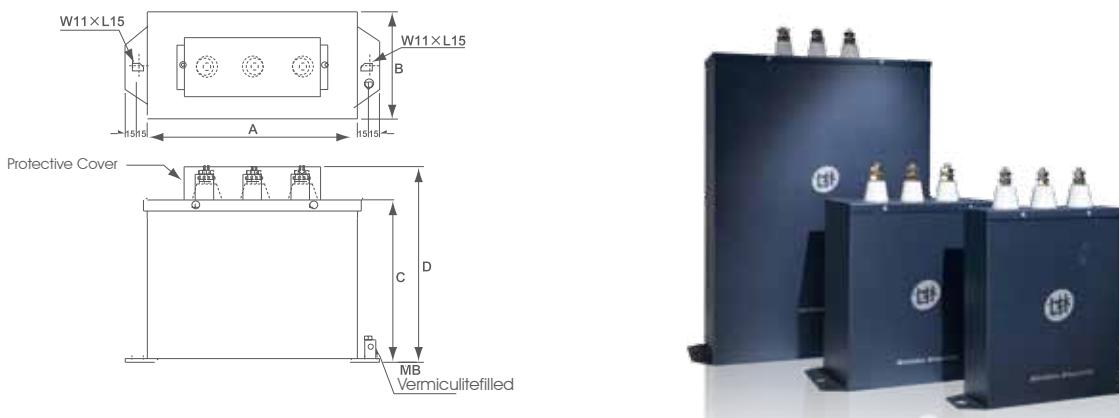

Main technical target

- Use condition: indoor, ambient temperature -25°C ~ +45°C, humidity ≤ 95%, below 2000m altitude
- Frequency: 60Hz(50Hz)
- Capacity tolerance: -5% ~ +10% (between phases tolerance within ± 3%)
- Dielectric Strength: T-T 2.15VAC, T-C 3000V 10sec
- Medium loss: below 0.2W/kVAR
- Max.premissible over voltage: rated voltage * 110%
- Max.premissible over current: rated current * 130%
- Protect level: IP42
- Discharge characteristic:
each capacitor unit has discharge resistor which reduces the terminal voltage of the capacitor to under 75V within 3 minute after the capacitor has disconnected from power source.
- standard: IEC 60871 or JIS 4902 or CNS 1372.

- System voltage: 220V, with 260V, 280V or above capacitor.
- capacitor control led by APFR or parallel connected capacitors and high harmonic, series reactor L=6%, 7%, 13%,15%。
- System voltage: 220V, with 240V or above capacitor.
- capacitor control led by APFR or parallel connected capacitors and high harmonic, series reactor L=6%。
- system voltage: 220V with 220V or above capacitor.

Applicable Environment : Capacitors equipped with traditional manual on/off switch. Installed separately, seldom on/off, and no harmonic load.

- Type *** is capacitor's rated voltage. For voltage 380 ~ 525 VAC, the dimension dose not change for 5、10、20 KVAR. The capacitors with 15~25~60KVAR capacity are smaller size models.
- Series reactors must be used in situations of using APFR control and high harmonic current. Suggest selected capacitor's rated voltage 1.25 times above system voltage. Please contact manufacturer for other special voltage or capacity capacitors.

- Series reactors must be used in situations of using APFR control and high harmonic current. Suggest selected capacitor's rated voltage 1.25 times above system voltage. Please contact manufacturer for other special voltage or capacity capacitors.

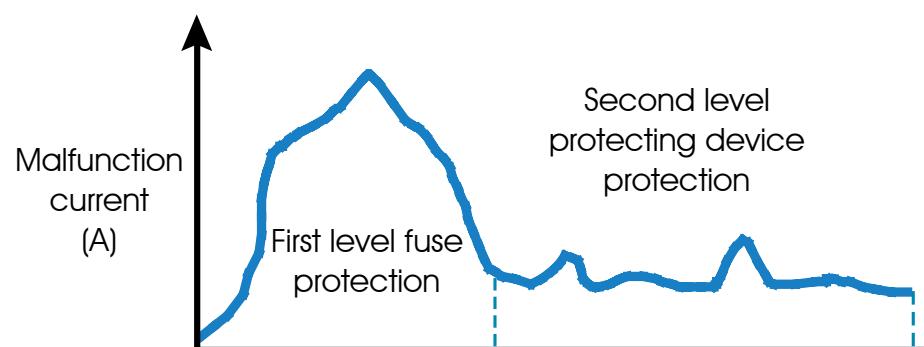

(2) Low voltage dry-type oval-shaped power capacitor KJ with explode-proof and improved power factor features.

Characteristic

- The capacitor is made with high-voltage endurance and excellent dielectric metallized polypropylene film. It provides self-restoring function, when the film breaks, the metallized electrode around the spark hole will be evaporated and recovers insulation at the same time, hence the capacitor can still work normally.
- The capacitor is sealed in a aluminium shell. The inside medium and outer aluminium case touch each other provide good heat dissipation which make slow temperature rise and long operation life.
- The capacitor uses see-through insulation protective cover. It is easy to check any problem on screws and contact wires.
- Double protection function and high safety assurance. Inside each capacitor element installed with fuse and whole unit installed with protection device which effectively reduce disaster.
- Electric bill greatly reduced by low loss medium, slow temperature rise, long operation life, and slow capacity decay.
- The capacitor is equipped with discharge resistors to ensure the safety of usage and maintenance.
- This is a special Eco-friendly product made by shinlin. It use flame retardant resin and seal, the leakage of oil can be prevented so does the pollution of environment.
- Patent NO. 185576. Use fuse and pressure type protective device to provide double protection.
- First level protection provided by fuse. Fuse on each capacitor element break instantly at short-circuit to protect from current surge.
- Second level protection provided by protecting device. A pressure-activate protective device guard capacitor unit from over-pressure caused by self-restoring and penetrating.

The capacitor is made with high-voltage endurance and excellent dielectric metallized

First level fuse protection : When sudden short-circuit occurs in the the capacitor, the substantial current produced will break the fuse.

Second level protection : The heat and gas produced from self-restoring ability of the capacitor will activate the pressurized protecting device.

Main technical target

- Application environment: indoor, ambient temperature $-25^{\circ}\text{C} \sim +45^{\circ}\text{C}$, humidity $\leq 95\%$, below 2000m
- Frequency : 60Hz .
- Capacity tolerance : $-5\% \sim +10\%$ (phase-to-phase deviation tolerance within $\pm 3\%$)
- Dielectric Strength : T-T 2.15VAC,T-C 3000V 10sec
- Medium loss: below 0.2W/KVAR .
- Max. permissible over voltage : rated voltage*110% (intermittent usage)
- Max. permissible over current : rated current*130%
- Discharge characteristic:each capacitor unit has discharge resistor which reduces the terminal voltage to under 50V within 1 minute after the capacitor has disconnected from power source.
- standard : IEC 831 、UL810 、JIS 4901 、UL810 、GB12747-91

· Series reactors must be used in situations of using APFR control and high harmonic current. Suggest selected capacitor's rated voltage 1.25 times above system voltage. Please contact manufacturer for other special voltage or capacity capacitors.

(4) Low Voltage Anti-Harmonic Capacitor KH Series

Electric system quality deteriorates in recent years due to the rapid electronic industry development and vast applications. The existence of Harmonic affects both system operation and safety of equipment. It became an non-ignorable factor regards of safety issues and the damages to the electric system.

The deterioration of power quality has caused unpredictable accidents from time to time so that capacitor has become the biggest victim. Therefore the choice of application environment and capacitor specification has to be more careful than ever. Hence, Shihlin produce Anti-Harmonic capacitors which meet customer's needs to ensure the system operation safety and also to reduce damage. This product has the following favorable features:

1. Protect the electric devices from being damaged by the harmonic.
2. Keep the electric system running normally in poor electricity supply.
3. Avoid the relative damage.

(5) μ F Type Indoor Capacitor Series

features

- The capacitor is made with high-voltage endurance and excellent dielectric metallized polypropylene film. It provides self-restoring function, when the film breaks, the metallized electrode around the spark hole will be evaporated and recovers insulation at the same time, hence the capacitor can still work normally.
- The capacitor is sealed in the aluminium shell. Inside medium and aluminum case touch each other provide good heat dissipation which make slow temperature rise and long operation life.
- Reliable and high safety assurance. It utilizes over-pressure protecting device to effectively reduce and isolate damages.
- Electric bill greatly reduced by low loss medium, slow temperature rise, long operation life, and slow capacity decay.
- The capacitor is equipped with discharge resistors to ensure the safety of usage and maintenance.
- This is a special Eco-friendly product made by shinlin and use flame retardant resin and seal, hence the leakage of oil can be prevented so does the pollution of environment.

Main technical target

- Application environment: indoor, ambient temperature $-25^{\circ}\text{C} \sim +45^{\circ}\text{C}$, humidity $\leq 95\%$, below 2000m
- Frequency : 60Hz
- Capacity tolerance : $-5\% \sim +10\%$ (phase-to-phase deviation tolerance within $\pm 3\%$)
- Dielectric Strength : T-T 2.15VAC,T-C 3000V 10sec
- Medium loss: below 0.2W/KVAR
- Max. permissible over voltage : rated voltage * 110% (intermittent usage)
- Max. permissible over current : rated current * 130%
- Discharge characteristic: there is an internal resistor which discharge the remaining charge to less than 50volts after one minutes.
- Standard : IEC 831、GB12747-91、JIS 4901、CNS1179,3738、UL810

• Series reactors must be used in situations of using APFR control and high harmonic current. Suggest selected capacitor's rated voltage 1.25 times above system voltage. Please contact manufacturer for other special voltage or capacity capacitors.

(6) Low voltage power dry type H level series reactor

Advantages of series reactor

- Series reactor can suppress high frequency surge caused by capacitor power switching.
- Series reactor can suppress over-voltage caused by repeated arc at instance of capacitor switch off.
- Series reactor can change system impedance, suppress harmonic voltage and current.

Application

- It can be connected to series capacitors to reduce or suppress sudden increase of capacitor current.
- Application environment: below 1000m, ambient temperature below 40°C, average temperature in 24 hours does not ove 35°C
- standard : JEC-2210(1990)
- Temperature rise: continuous rated current 135% , coil temperature does not to outstrip 120°C °
- dielectric withstand voltage: AC 4000V/min °
- Max safety current: 5th harmonic current contain below 35%, compound current below 120%.
- Reactor insulation level: H level. Protection level: IPOO

(7) The selection Of Series Reactor After Increase Of Capacitor Voltage

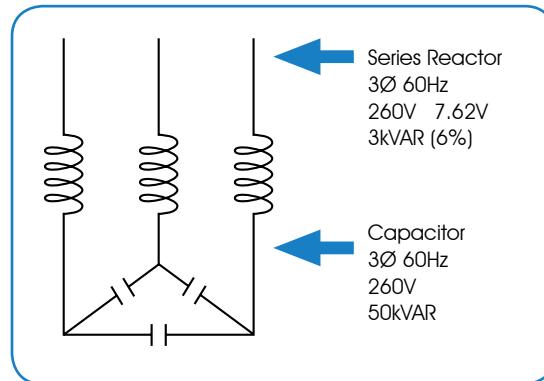

Wrong selection
System Voltage 220V

The rated voltages of reactor and capacitor are different, the ratio of impedance is 4.3% (not 6%)

Correct selection
System Voltage 260V

The rated voltages of reactor and capacitor are the same, the ratio of impedance is 6%

Calculation of the Capacitance and Reactance ratio

$$(220V/\sqrt{3}) \times 6\% = 7.62V$$

$$XL = V^2/Q = 7.62^2/3kVAR/3 = 0.0581 \Omega$$

$$XC = V^2/Q = 260^2/50kVAR = 1.352 \Omega$$

$$XL/XC = 0.0581 / 1.352 = 4.3\%$$

$$(260V/\sqrt{3}) \times 6\% = 9.01V$$

$$XL = V^2/Q = 9.01^2/3kVAR/3 = 0.0811 \Omega$$

$$XC = V^2/Q = 260^2/50kVAR = 1.352 \Omega$$

$$XL/XC = 0.0811 / 1.352 = 6\%$$

(8) Low Voltage Power Factor Improved Capacitors General Inspection And Diagnose

Break down check by visual inspection

Indoor type : If the Capacitor case lid open or internal fillings ejected, it means the capacitor is broken.

Basic function inspection

First of all, the capacitor must be switched off at least 3 minutes , then phases to ground discharge followed by phase to phase discharge.

Capacitance is measured by digital reading capacitor meter

1.Half the rated capacitance printed on name plate or certificate is the phase to phase capacitance.

2.Identify phase: The U, V, W phases are identified from the name plate side.

3.The rated capacitance caculated by measured value

$$U-V = a (\mu F)$$

$$U-W = b (\mu F) \therefore (a+b+c) \times 2 \div 3 = \text{rated capacitance}$$

$$V-W = c (\mu F)$$

4.Determined by the rated capacitance

- Within -5% ~ +15% of rated capacitance.
- If multiple capacitor units are connected in parallel, the total capacitance is derived by one unit's capacitance times the number of units.
- If interphase unbalance ratio is < 108%.
Use the phase in lowest ratio then divided by other two phases individually and get percentage.

(9) Low Voltage Capacitor's Maintenance

Daily maintenance

1. The capacitor's ambient temperature must be lower 45°C, At installation consider following items: ambient temperature, ambient temperature rise, ventilation equipment, and heat source.
2. The condition of switches used in capacitor's protecting device must be checked to prevent poor contacting.
3. Inspect if applied voltage and current are normal. The capacitor's operation life will be shortened if it is used in over-voltage condition which causes capacitance increase, temperature rise, and also damage internal insulation elements due to abnormal voltage.
4. Check if any abnormal condition at connection wires and capacitor terminals.
5. Check for other abnormal situations.

Regular maintenance

1. After using capacitor for a long time, accumulated dusts on bushing must. Dusts mixed with moisture will reduce the insulation resistance and cause electricity leakage which may activate protective device. To clean bushing and to avoid electric shock, power to capacitor must be cut for 3 minutes and capacitor be fully discharged thru ground wire.
2. All capacitors must be cleaned and polished regularly to help release surface heat.

(10) Capacitance Coefficients Calculation Of The Capacitors To Be Installed

Example:

Load of the plant:500kW

Power factor before improvement: $\cos \theta_1=0.6$

Desired power factor after improvement: $\cos \theta_2=0.95$

Capacitance of the capacitor required
 $=500*1.005 \approx 500\text{KVAR}$

(Note:1.005 is obtained from the following table)

Conversion between KVAR and μF

$$C (\mu\text{f}) = \frac{\text{KVAR} \times 10^9}{2 \pi f E^2}$$

If 50Hz, $2 \pi f=314$

If 60 Hz, $2 \pi f=377$

In the above equation:

KVAR=Value of capacitance

f=Frequency Hz

E=Rated voltage V

440	-	-	-	-	-	-	-	1,093	1,190	1,291	1,424	1,860	-
460	-	-	-	-	-	-	-	-	1,089	1,181	1,303	1,701	2,316

Example : Assuming the system voltage is 380V, the required capacitance is 100KVAR, considering the voltage increase due to series connected reactor and high harmonics, the capacitor rated voltage is proposed to increase to 440V. The conversion formula as follows:

Required capacitor capacitance = $100\text{KVAR} \times 1.341$ (obtained from above table) = 134.1KVAR

We Provide Great Quality & Customer's Satisfaction

Over 50 Year Experience
